

1. (Currently Amended) A cleaning device comprising:
a base material sheet; and
a fiber bundle comprising a large number of fibers aligned in a longitudinal direction (W) thereof, and having a bundling portion (40) connecting the fibers at a center portion thereof along a direction of extension (Y) crossing the longitudinal direction of the fibers, said bundling portion having edges (A,B) extending generally parallel to said direction of extension,

wherein the fiber bundle is bonded to the base material sheet by means of an adhesive, and the fiber bundle comprises movable portions which have respectively different lengths between (1) respective fixed ends edges (A,B) of the bundling portion and portions (C) of the fibers bonded by the adhesive (51), and (2) between distal ends (21) of the fibers in the longitudinal direction of ~~the length of the fiber bundle thereof and in the direction of thickness thereof~~ the portions of the fibers bonded by the adhesive (51).
